# Perceptive Content Server Foundation 23.1 (7.10.x) Update Guide

This readme file provides important information about updating ImageNow products from a previous version of 6.x to Perceptive Content Foundation EP3 (7.6.x). Read this file before you update Perceptive Content Server, clients, agents, database, and extensions.

**Note** This document does not provide information on performing a more significant upgrade from a version prior to 6.x. If you are attempting to upgrade from a version previous to 6.x, Hyland Software recommends you arrange a managed upgrade. For more information, contact your account representative.

## Prepare for the update

Complete backups of all Perceptive Content Server data before beginning any update installation. Neither Hyland Software, nor any of its authorized resellers are responsible for lost data caused by the update procedure described in this document.

Before updating your ImageNow system, verify that your system matches the requirements listed in the Technical Specifications.

## Product version matrix

Release Name	Product Version Number
Foundation 23.1	7.10
Foundation 22.2	7.9
Foundation 22.1	7.8
Foundation EP4	7.7
Foundation EP3	7.6
Foundation EP2	7.5
Foundation EP1	7.4

## Special considerations

Before you perform an update of your ImageNow system, make sure that you keep in mind the considerations specific to your system configuration.

### Active-Active

- In an active-active environment, there should only be one node instance per machine, spread across several machines. While the separate hardware devices have some shared file systems states, they are provided through third-party clustered file system products.
- If you are switching to an active-active server configuration during your 7.0 or higher update, note that switching involves various considerations.

- The Perceptive Content Shared Directory location is specified via the environment.ini. To change the location of the Perceptive Content Shared Directory refer to the *Perceptive Content Shared Directory Migration Guide*.

#### **64-bit**

- A 64-bit operating system is required to run 64-bit applications. If you are not currently running a 64-bit operating system, you must upgrade prior to upgrading Perceptive Content.
- Before you install Forms Server, you must have your web application server, such as Apache Tomcat, installed. The version of the web application server (32 or 64-bit) must be compatible with the Forms Server version (32 or 64-bit).
- Verify the compatibility of all of your applications and business applications with a 64-bit operating system before you install Perceptive Content.

#### **Database**

- Prior to ImageNow 6.7, the INOW6 database tables resided in the DBO schema. For new installations of Perceptive Content 7.0 and higher, the default database name is INOW and the tables reside in the INUSER schema. During an upgrade to Perceptive Content 7.0 and higher, all tables are transferred from the DBO schema to the INUSER schema. Any permissions that have been granted to the ImageNow tables, are lost during the transfer.

**Note** This change also affects external systems that access the ImageNow database. If your users have hard-coded access to the ImageNow database tables using the OWNER.TABLE\_NAME structure, you must change it when performing the update to 7.0 or higher.

- For Microsoft SQL databases, you must execute a command to grant permissions to the entire schema or multiple commands to grant permissions at the object level.
- To grant permissions to the entire schema, the following example shows the syntax structure used to grant permissions on the entire INUSER schema to a specific user:

```
GRANT SELECT [INSERT, UPDATE, DELETE] ON SCHEMA :: inuser TO reports;
```

- A working statement is shown in the following.

```
GRANT SELECT ON SCHEMA :: inuser TO reports; -- To Grant
only SELECT privs on the entire INUSER schema to the reports user.
GRANT SELECT, INSERT, UPDATE, DELETE ON SCHEMA :: inuser TO reports; -- To Grant
FULL privs on the entire INUSER schema to the reports user.
```

- For Oracle databases, the INUSER user needs the execute privilege on the DBMS\_RANDOM package. Before running the database incremental script, you must connect to the INOW6 database as SYS and execute the statement to grant the execute permission:

```
SQL> grant execute on DBMS_RANDOM to inuser;
```

The incremental will not complete without this.

- Starting in version 6.7.0.2787, the INEMUSER schema was added to the database to hold the IN\_EXTERN\_MSG\_SEQ table. This isolates the table from the rest of the INUSER schema. For SQL Server, the INEMUSER schema is owned by the INUSER user and has full privileges on the schema. For Oracle, in addition to the IN\_EXTERN\_MSG\_SEQ table, there is also a sequence and a trigger that are created in the INEMUSER schema that is used for populating the table with sequential numbers. For Oracle, privileges should be granted on the INEMUSER objects to the INUSER user. If any database backup or replication jobs are schema based, they should be modified to include the INEMUSER schema.

- Filtered indexes are now part of the Perceptive Content 7.4 database schema.

### Microsoft SQL Server

For the SQL Server to create and use filtered indexes, the following database parameter changes are required.

**Note** You must have the proper privileges to set database options when executing the database incremental scripts.

```
ALTER DATABASE INOW SET ANSI_NULLS ON  
ALTER DATABASE INOW SET QUOTED_IDENTIFIER ON  
ALTER DATABASE INOW SET CONCAT_NULL_YIELDS_NULL ON  
ALTER DATABASE INOW SET ANSI_PADDING ON  
ALTER DATABASE INOW SET ANSI_WARNINGS ON  
ALTER DATABASE INOW SET ARITHABORT ON  
ALTER DATABASE INOW SET NUMERIC_ROUNDABORT OFF
```

The following indexes are recreated as filtered indexes in the 7.2.3 to 7.4.0.3 database incremental scripts.

```
INUSER.IN_INSTANCE_PROP.INSTANCE_PROP_IDX_01 - Filter on WHERE (IS_NULL = 1) (new index)  
INUSER.IN_INSTANCE_PROP.INSTANCE_PROP_IDX_02 - Filter on WHERE (STRING_VAL IS NOT NULL)  
INUSER.IN_INSTANCE_PROP.INSTANCE_PROP_IDX_03 - Filter on WHERE (IS_NULL = 0)  
INUSER.IN_INSTANCE_PROP.INSTANCE_PROP_IDX_04 - Filter on WHERE (TIME_VAL <> '1970-01-01 00:00:00.000')
```

Filtered indexes help promote improved query performance and plan quality as well as reduced index maintenance and storage costs for the IN\_INSTANCE\_PROP table.

### PostgreSQL

The following indexes are recreated as partial indexes in the Perceptive Content 7.2.3 to 7.4.0.3 database incremental scripts.

```
INUSER.IN_INSTANCE_PROP.INSTANCE_PROP_IDX_01 - Filter on WHERE (IS_NULL = 1) (new index)  
INUSER.IN_INSTANCE_PROP.INSTANCE_PROP_IDX_02 - Filter on WHERE (STRING_VAL IS NOT NULL)  
INUSER.IN_INSTANCE_PROP.INSTANCE_PROP_IDX_03 - Filter on WHERE (IS_NULL = 0)  
INUSER.IN_INSTANCE_PROP.INSTANCE_PROP_IDX_04 - Filter on WHERE (TIME_VAL <> '1970-01-01 00:00:00.000')
```

Partial indexes help promote improved query performance and plan quality as well as reduced index maintenance and storage costs for the IN\_INSTANCE\_PROP table.

### Deprecated Cryptographic Algorithms

The following cryptographic algorithms are deprecated and should no longer be used. Any user supplied keys that were generated using these algorithms should be updated to use newer algorithms to ensure compatibility with future Perceptive Content releases.

- Symmetric Ciphers - Blowfish, CAST, DES, IDEA, RC2, RC4, RC5, SEED
- Hashing Algorithms - MD2, MD4, MDC2, WHIRLPOOL, RIPEMD160

## Digital Signatures

- If the system has been upgraded from a previous version of ImageNow to Perceptive Content 7.x, you must create a new Digital ID and password to apply digital signatures. Digital signatures applied to documents in ImageNow 6.6 or 6.7 appear correctly on the pertinent documents. However, to apply any new digital signatures in the Perceptive Content 7.x system, all users are prompted to create a new Digital ID.
- When migrating from Windows to Linux with a version of Perceptive Content Server prior to 7.2.0, you must execute the `intool --cmd expire-digital-ids` command to immediately expire all active Digital IDs. Execute the `inUpgradeutil upgrade-digsig-version` command when updating the database to enable use of digital signatures on the system administered from a Linux server.

## Envoy Replacement

The 7.2 release added Perceptive SOAPBridge Connector 1.0 as a replacement for Envoy. Perceptive SOAPBridge Connector is a REST service that allows you to facilitate automated, back-end integration of your SOAP business application.

To configure SSL connections from Perceptive Content to Perceptive Connect Runtime, see the *Perceptive Connect Runtime Installation and Setup Guide*. To establish trust between SOAPBridge and a remote service, see the 1.0.x *Perceptive SOAPBridge Connector Installation and Setup Guide*.

**Important** Web Service Security, an extension to SOAP, is not supported.

The 7.2 release also removed the following Envoy-specific items from iScript INRemoteService.

- **Deprecated** `setLoggingInterceptor`
- **Deprecated** `setSSLCredentials`
- **Deprecated username and password from** `INRemoteService addWS(string serviceName, string url, string desc, INWSAuthType/string authType)`
- **Deprecated** `INRemoteService addWS(string newServiceName, string newWsdl, string newDesc, INWSAuthType/string authentication, string username, string password, INWSSPasswordType, string passwordType)`
- **Deprecated** `INRemoteService addWS(string newServiceName, string newWsdl, string newDesc, INWSAuthType/string authentication, sCertFilePath, sCertFilePwd, sPrivateKeyFilePath, sPrivateKeyFilePwd)`
- **Deprecated username and password from** `updateWS(string newServiceName, string newWsdl, string newDesc, INWSAuthType/string authentication)`
- **Deprecated** `updateWS(string newServiceName, string newWsdl, string newDesc, INWSAuthType/string authentication, string username, string password, INWSSPasswordType/string passwordType)`
- **Deprecated** `updateWS(string newServiceName, string newWsdl, string newDesc, INWSAuthType/string authentication, sCertFilePath, sCertFilePwd, sPrivateKeyFilePath, sPrivateKeyFilePwd)`

## Full Text Search Agent

- The 7.2 release removed Full Text Search Agent, which includes the removal of the Full Text section in the `inow.ini` file. Content automated system queues (ASQ) are no longer applicable since Content ASQs submitted items to Full Text Search Agent. Upgrading does not remove preexisting queues and

unprocessed items could remain in the queue. You may need to update capture profiles, remove existing items from the queue and/or alter any routing rules associated with the queue.

- Upgrading to 7.2.x also removes all full text search filters. We recommend uninstalling inserverFT prior to upgrading to 7.2.x
- The removal of Full Text Search Agent now requires you to set the REMOTED value in the inserverRec.ini file to TRUE, even if Recognition Agent is running locally.

### Integration Server

- Starting with Perceptive Content, version 7.0.x and higher, you must install Perceptive Integration Server as part of the Business Insight product suite.
- In the 7.9.0 release of Integration Server HTTP method overriding has been disabled by default. If using an HTTPClient which doesn't support all necessary HTTP request methods, see Appendix E: Enable HTTP Method Override in the Integration Server Installation Guide.

### Message Queuing Agent

Message Queuing Agent was removed with the 7.1.5.1516 release. This includes the removal of the following items.

- inserverMQ.exe on Windows
- inserverMQ on Linux
- inserverMQ.ini file
- IN\_MESSAGE database table
- IN\_MESSAGE\_QUEUE database table
- IN\_MESSAGE\_QUEUE\_MASTER database table

### Object Store Manager

The 7.2 release removed the Content Addressable Storage (CAS) integration type used by OSM sets and OSM trees. The `inUpgradeUtil upgrade-cas-to-ext` command converts the OSM CAS sets to OSM EXT sets automatically for Windows as part of the upgrade process. On Linux, you must manually execute the command.

### RabbitMQ and Erlang

- Perceptive Content Server and all Perceptive agents, versions 7.1.4.1269 and higher, depend on RabbitMQ, a third-party message queuing broker. RabbitMQ is an open-source software that requires Erlang, a programming language. You must download and install the supported versions of both products prior to upgrading to Perceptive Content 7.1.4.1269 or higher. See the RabbitMQ website for more information, and to download and install the product. For further considerations, see the following list.

**Important** Prior to installing RabbitMQ and Erlang, review the Perceptive Content Server > Message Queuing specifications in the 7.1.x and higher *Perceptive Content Technical Specifications* for the supported versions of both products.

- Perceptive Content relies on the AMQP 0.9.1 protocol from RabbitMQ, which is enabled by default.

- When utilizing Active-Active mode for Perceptive Content, you must configure multiple cluster nodes of RabbitMQ to achieve high availability for the system. For more information, see the RabbitMQ Clustering Guide.
- You are not required to share the same operating system or host machine for Perceptive Content and RabbitMQ. We recommend separate resources for RabbitMQ cluster nodes for the best high-availability and workload balancing.
- You must configure RabbitMQ for privacy over data connections. For more information, see the RabbitMQ Configuration Guide.
- If running in a cluster environment, you must upgrade all nodes at the same time and all nodes must be shut down during the upgrade. RabbitMQ and Erlang require that you are running the same major and minor version on all nodes in a cluster. For more information, see the RabbitMQ clustering guide.
- Eight new server settings were added to the Message Queuing group in the inow.ini configuration file in Perceptive Content version 7.1.4.1269, and seven new client settings were added to the group in version 7.1.5.1516. On Windows, prompts allow you to update these settings during the upgrade. On Linux, you must update the inow.ini file manually. For more information on the new settings, see the “inow.ini [Message Queuing] settings” topic of Manage Content help. For information on updating the inow.ini file on Linux, see the *Perceptive Content Server Installation and Setup Guide*.
- Two new inUpgradeUtil commands were added to Perceptive Content, version 7.1.5.1516: inUpgradeUtil process-jobs-invalid-state and inUpgradeUtil republish-jobs. The inUpgradeUtil process-jobs-invalid-state command scans the job tables and identifies jobs held in an invalid state. The jobs are marked as completed with an error status. The inUpgradeUtil republish-jobs command scans the job tables and identified jobs that have not started. These jobs are published using the new message queuing system and then processed by the appropriate agent. Note that the Windows and Linux install scripts run these commands as part of the upgrade process.

**Note** For more information on RabbitMQ, visit the RabbitMQ documentation site.

## Windows operating systems

- When you update your ImageNow system on Windows, perform the update steps with the administrator user account used when ImageNow was originally installed. If this account is no longer available, and you licensed your version of ImageNow per machine rather than per user, you can use a local administrator account.

## Secure Protocols for Microsoft Windows HTTP Services

Perceptive Content leverages Microsoft Windows HTTP Services (WinHTTP) for web based integrations on Windows operating systems. Prior to Perceptive Content Foundation 22.2, secure protocols for HTTPS connections were explicitly specified when using WinHTTP. This meant that Perceptive Content could leverage secure protocols that could differ from system default secure protocols. Going forward, Perceptive Content applications will no longer specify secure protocols when using WinHTTP and will rely on the system `DefaultSecureProtocols` registry entry. This allows administrators of Perceptive Content to use newer TLS protocols and prevent older protocols natively without requiring updates to Perceptive Content. In some cases, the system default secure protocols may be different from the secure protocols that Perceptive Content previously used. If a secure protocol cannot be negotiated between Perceptive Content and an external Secure HTTP web service, connections will fail to be established. To resolve this issue ensure both the Windows operating systems hosting Perceptive Content and Secure HTTP services Perceptive Content integrates with are using the latest recommended secure protocols, such as TLS 1.2 or TLS 1.3. If Perceptive Content needs to support additional secure protocols those can be specified using the `DefaultSecureProtocols` registry entry.

For more information on configuring the `DefaultSecureProtocols` registry entry refer to **Appendix G: Configure default secure protocols for Microsoft Windows HTTP Services**.

## Update Perceptive Content Server

This release contains updates to the Perceptive Content Server on Windows or Linux running an external SQL database, such as Oracle or Microsoft SQL. Follow the steps in the procedure below that describes your environment and DBMS.

**Note** Before beginning an update of your Perceptive Content Server, perform a backup of your database. For more information on backing up a database, refer to the *Perceptive Content Best Practices for <database>* document.

### Update Perceptive Content Server on Windows

To update Perceptive Content Server on a Windows operating system, complete the following procedures.

1. Verify your Perceptive Content version.
2. Verify remote Perceptive Content shared directory access.
3. Reset working workflow items.
4. Stop Perceptive Content services.
5. Back up your database.
6. Back up your settings.
7. Download updated files.
8. Update the SQL or Oracle database.
9. Update the Perceptive Content Server.
10. Verify your Perceptive Content database.

#### Verify your Perceptive Content version

Before you begin your update, verify your current version of Perceptive Content. To look up this information, view the properties for the `inserver.exe` file.

To perform this procedure, complete the following steps.

1. In Windows Explorer, navigate to the `inserver.exe` file. The default location for this file is **[drive]:\inserver\bin64**.
2. Right-click `inserver.exe` and select **Properties**.
3. In the **Properties** dialog box, click the **Details** tab to view the file version.

#### Verify remote Perceptive Content shared directory access

When the installer accesses a remote location, it accesses the location in both the current user and SYSTEM context. You must verify both users have access to the shared directory. You can use the `net use` command to create sessions in the current context. You can also create a session in the SYSTEM context by using Microsoft's `PsExec` command to run the `net use` command in the SYSTEM context.

**Note** The **net use** command only adds the session for the current context. **PsExec** allows you to run the command in the SYSTEM context, which then adds the session in the SYSTEM context.

## Reset workflow items

Before you stop your Perceptive Content services, to reset any workflow items in a working state, you must run the following command:

```
intool --cmd reset-item-status
```

## Stop Perceptive Content services

To update your system, you must stop the Perceptive Content services. The Perceptive Content Server installation wizard automatically stops the Perceptive Content services, but you can also complete the following steps to stop all services manually.

**Note** Close all services and client connections before you stop INServer, including any remote agents.

1. Open the **Services** dialog box.
  - In Windows 7, to locate the **Services** dialog box, from the **Control Panel**, click **Administrative Tools**, and then click **Services**.
2. Right-click each ImageNow service and click **Stop**.

## Back up your database

Perform a full backup of your database following the documentation for your database.

## Back up your settings

When performing an upgrade, the system automatically retains your customized settings in the INI files. However, we recommend backing up these files as a safety precaution to ensure you retain your unique customizations. Complete the following action:

- Copy your INI files to a directory other than inserver, for example c:\tmp.

## Download updated files

To download Perceptive product installation files, complete the following steps.

2. Go to the Hyland Community site.
3. From the menu, click **Support** and then under **Software Downloads** select **Perceptive Downloads**.
4. Find and download the installer file corresponding to the version to be installed.

**Note** New and updated documentation and help topics are regularly published to the documentation website at [docs.hyland.com](http://docs.hyland.com).

## Update the SQL or Oracle database

You must run the appropriate incremental files for your database application and the current version of Perceptive Content Server. Follow the instructions appropriate for your RDBMS for running an incremental database upgrade script. A qualified DBA should perform this action. For more information on best practices for your database, refer to the *Perceptive Content Best Practices for <database>*.

**Note** If you are updating an Oracle database you may choose to delete and temporarily disable the Oracle recycle bin prior to running the upgrade script. This prevents potential errors related to objects that exist in the recycle bin.

1. Click **Start**, and then click **Run**.
2. In the **Run** dialog box, type **cmd** and then click **OK**.
3. In the **Command Prompt** window, change to the **[drive:]\\inserver\\bin** directory.
4. Run the following INTTool command to view the incremental version of the database you are running:  

```
intool --cmd get-db-version
```
5. In the **Perceptive Content Server <database type> DB Creation and Updates Scripts Build <build number>** file, apply each incremental file individually in order from the current version of your database to the latest incremental.

**Note** Incremental-SS\_6.6\_to\_6.7.0.2222.sql and later incrementals put the INOW6 database in **SINGLE\_USER** mode while Snapshot Isolation and Row Versioning are enabled. The current upgrade connection remains active. The system stops, rolls back, and then disconnects any other connections to the database to complete the **READ\_COMMITTED\_SNAPSHOT** command. The system returns the database to **MULTI\_USER** mode and executes the rest of the script.

## Remove INUSER schema sysadmin server role

**Important** Complete the steps in this section prior to updating the Perceptive Content Server.

In Perceptive Content Server 7.0 and higher, all Perceptive Content tables and indexes reside in the INUSER schema. You must ensure that the INUSER schema does not have the sysadmin server role granted to it. If the INUSER schema has the sysadmin server role, this role sets the default schema as the database owner instead of the INUSER schema. As a result, Perceptive Content Server might not start, and connections to the INOW6 database cannot query the Perceptive Content tables. To remove the INUSER schema sysadmin server role, complete the following steps.

1. Open **SQL Server Management Studio**.
2. Connect to the server hosting the SQL Server instance that contains the INOW6 database.
3. In **Object Explorer**, expand **Security**, and then expand **Logins**.
4. Right-click **inuser**, and then click **Properties**.
5. On the **Login Properties – inuser** dialog box, click **Server Roles**.
6. In the **Server roles** area, uncheck **sysadmin**.
7. Click **OK**.
8. Close **SQL Server Management Studio**.

## Update the Perceptive Content Server

Complete the following steps to update the Perceptive Content Server. For more detailed information about installing the Perceptive Content Server, refer to the *Perceptive Content Server Installation and Configuration Guide*.

1. Double-click the **Perceptive Content Server <64 or 32-bit> for MSSQL and Oracle <patch number>** file to run the Perceptive Content Server installer.

### Notes

- If you have User Account Control (UAC) with your Windows operating system, right-click the installer and select **Run as Administrator**.
  - During this installation, a message appears to inform you that this is an update. If you do not receive this message, stop the installation and verify that you are logged on as the same Administrator user account used when ImageNow was originally installed.
2. Compare the previous INI files from your backup copy of the **/inserver/etc** directory with the new INI files in **/inserver/etc**. The Windows installer automatically adapts your previous settings to the new settings; however, the installer overwrites any custom comments, settings, or notes that you might have previously added. Alter the new INI files in **/inserver/etc** as needed.

## Verify your ImageNow database

Before proceeding, use the following procedure to verify your ImageNow database. The INTTool command you run in this procedure displays any differences between the latest version of the Perceptive Content database and the version of ImageNow you are currently using.

1. Click **Start**, and then click **Run**.
2. In the **Run** dialog box, type `cmd` and then click **OK**.
3. In the **Command Prompt** window, change to the `[drive]:\inserver\bin` directory.
4. Enter the following command at the prompt.

```
intool --cmd db-schema-validation
```

Text describing the validation appears on the screen. If you see the message: **Database validated. No inconsistencies detected**, your database is aligned and you do not need to do anything further to update the database. If you get any other message, contact Product Support and provide them with a copy of any message you received.

## Update Perceptive Content Server on Linux

**Important** Perceptive Content 7.3.0 is the first 64-bit release of Perceptive Content on Linux. We strongly recommended that you first upgrade to Perceptive Content 7.2.3 prior to upgrading to Perceptive Content 7.3.0 and later. This reduces the scope of the upgrade and focuses on reviewing and validating Perceptive Content components and processes on 64-bit Linux. For more information, refer to [Appendix F: Upgrade to 64-bit Perceptive Content on Linux](#).

**Note** Before beginning an update of your Perceptive Content Server, perform a backup of your database. For more information on backing up a database, refer to the *ImageNow Best Practices for <database>* document.

1. Stop Perceptive Content services.
2. Reset working workflow items.
3. Perform a backup of your database.
4. Back-up your settings.
5. Upgrade the Perceptive Content database.
6. Upgrade the Perceptive Content Server.
7. Verify your Perceptive Content database and execute upgrade scripts.
8. Start the Perceptive Content services.

## Stop Perceptive Content services

From /inserver/bin, stop all ImageNow services. All services and client connections must be closed before inserver is stopped, including any remote agents.

1. To determine which services are running, enter the following information.

```
./inserver -s
```

2. To stop all services, enter the following information.

```
./<agent name> -k
```

**Note** After you have completed an upgrade, you can use the following command to stop all running services.

```
./inserver -ka
```

## Reset workflow items

Before you stop your ImageNow services, to reset any workflow items in a working state, you must run the following command.

```
./intool --cmd reset-item-status
```

## Back up your database

Perform a full backup of your database following the documentation for your database.

## Back up your settings

Back up your configuration files to ensure you retain your unique customizations.

- Perform the following action to copy the contents of /inserver/bin and /inserver/etc directory to a backup directory.

```
cp -R /inserver /<path to backup directory>
```

## Update the Perceptive Content database

Run the appropriate DDL script for your database application. Follow the instructions appropriate for your RDBMS for running an incremental database upgrade script. This should be performed by a qualified DBA. Apply each incremental file individually in order from the current version of your database to the most updated incremental.

## Update the Perceptive Content Server

Complete the following steps to update the Perceptive Content Server. For more information about installing the Perceptive Content Server, refer to the *Perceptive Content Server Installation and Configuration Guide*.

1. Use the **mv** command to move the **ImageNow-Server-Full-Linux64\_x.x.x.x.tar.gz** file to the **/inserver** directory.
2. From **/inserver**, unzip and tar the installer file.

```
tar -xzvf ImageNow-Server-Full-Linux64_x.x.x.x.tar.gz
```

3. From the **inserver** directory, issue the following command to change ownership.

```
chown -R root:bin *
```

4. Compare the previous INI files from your backup copy of the **/inserver/etc** directory with the new INI files in **/inserver/etc**.

## Verify your Perceptive Content database and execute upgrade scripts

Configure odbc.ini as documented in the *Perceptive Content Server Installation and Configuration Guide*.

1. Set up key environment variables by sourcing the **setenv.sh** script from the **/inserver/bin** directory.

**Note** This step is necessary every time a new login session is established.

```
./setenv.sh
```

2. Execute the following intool schema validation command.

```
./intool --cmd db-schema-validation
```

The system displays text describing the validation. If you see the message: **Database validated. No inconsistencies detected**, your database is aligned and you do not need to do anything further to update the database. If you see any other message, contact Product Support and provide them with a copy of any message you received.

3. Run the **upgrade\_to\_latest.sh** file, with an argument specifying the version of Perceptive Content Server you are upgrading from, including the major, minor, and patch numbers. For example:

```
./upgrade_to_latest.sh 7.10.0
```

4. Review the update log and verify that no errors are listed. This file is located in **/inserver/log** directory and is named **intool\_Primary\_<date>.log**. The log contains the changes performed by the update steps.

## Start the Perceptive Content services

- Start Perceptive Content services by running **`pwd`/service\_name** for all services in the **/inserver/bin** directory.

```
`pwd`/inserver -start
`pwd`/inserverBatch -start
`pwd`/inserverAlarm -start
`pwd`/inserverJob -start
```

## Obtain updated license files

To obtain the hardware information for the Perceptive Content Server, you must be the admin user on Windows. When you update from ImageNow 6.x, you need to acquire updated licenses, but do not need to purchase new licenses unless you purchase additional products.

1. Start Perceptive Content Server. If you have an active-active setup, you must start all instances of Perceptive Content Server on all nodes.
2. To generate a system fingerprint using Perceptive Content Management Console, complete the following substeps.
  1. Click **Start** and select **All Programs > Perceptive Content > Perceptive Content Management Console**.
  2. In the **Login** page, click **License Manager**.
  3. In the **License Management** dialog box, select **Save system fingerprint** and click **OK**.

4. In the **Save As** dialog box, enter a name for the file and then navigate to the location where you want to save the report. Click **Save**.
3. To generate a system fingerprint using INTTool, complete the following steps:
  1. Click **Start**, and then click **Run**.
  2. In the **Run** dialog box, type **cmd** and then click **OK**.
  3. In the **Command Prompt** window, change to the **[drive:]\\inserver\\bin64** directory.
  4. Enter the following command at the prompt.

```
intool --cmd license-sysfp
```
  5. The file is saved with an **SYSFP** extension in the **[drive:]\\inserver\\bin64** directory.
4. Contact your Enterprise Software representative for instructions on where to send the system fingerprint file to obtain your license. The system fingerprint file has an **SYSFP** extension.
5. When you receive the license files, store the license files in a temporary directory on the Perceptive Content Server computer.

## Install Updated Perceptive Content product licenses

Before entering your licenses, you must have installed the Perceptive Content Server and at least one Perceptive Content Client. You must have Service Administrator privileges to install Perceptive Content licenses. The Perceptive Content Client must be available on a Windows machine to install the Perceptive Content product licenses.

1. When you receive the license files from your Enterprise Software representative, copy them to a temporary folder where you can access them with the Perceptive Content Client.
2. To upload licenses, complete the following substeps.
  1. Click **Start** and select **All Programs > Perceptive Content**.
  2. In the login page, click **License Manager**.
  3. In the **License Management** dialog box, select **Upload Licenses** and click **OK**.
  4. Navigate to the folder where the Perceptive Content license files are stored, select the **LIC** files to upload, and click **Open**.
  5. Enter the **User Name, Password**, and **Server Location** and click **OK**.
  6. Optional. The License Upload dialog box lets you view the type name, actual license code, and status of each license upload. To display detailed information for a specific license, select the appropriate row.
3. Click **OK**.

## Upgrade roles and privileges

When you update from Perceptive Content 6.x, users with the owner or manager roles are assigned new user roles and privileges to preserve their former capabilities in the new environment. The following user roles and privileges are assigned during an upgrade.

6.3.x-6.7.x Role	7.x Role and Privilege Set
------------------	----------------------------

Owner user or manager user	<p>Perceptive Manager</p> <p>Department Manager of the Default department</p> <p>All Global privileges</p> <p>The ability to override private documents in the Client, normally granted in INTTool.</p>
----------------------------	---

When a user becomes a Perceptive Manager because of the upgrade, the user gains access to most of the privileges in the system. When you demote a Perceptive Manager, that user only loses the manager privileges in the global privilege category, while the other global privileges assigned during the upgrade remain active. Therefore, if you demote a Perceptive Manager after upgrade, you may need to disable several privileges manually that were assigned to that user.

Migration functionality is enabled for Perceptive Managers by default. You can disable migration for all users using an INTTool command.

In Perceptive Content 7.0.x, the User Security privilege was removed. This privilege is now split into several privileges that grant users the ability to assign specific categories of privileges to users and groups. This split allows for more flexibility in the security capabilities granted to users in your organization. In addition, the Groups privilege, from the manage section of the global privilege category, no longer grants the ability to assign any privilege to groups, but instead only grants the ability to create a group and modify the members of a group. All users and groups with the Groups privilege in your prior version of Perceptive Content retain that privilege during upgrade, but you must assign additional privileges to the users and groups to reinstate their former ability to assign privileges to groups.

The system automatically generates a text report in the etc directory of your server, displaying the users and groups who had the User Security privilege and Groups privilege granted or denied in your prior version of Perceptive Content.

Changes were also made to batch processing privileges. The **Drawer > Batch (Proposed Key) > Process** privilege is now required for batch processing and must be granted to users manually after you upgrade.

We recommend you reassign privileges and user roles after you upgrade to 7.x. For more information, refer to *Department Administration Best Practices*.

## Update Agents

You can update your agents using the procedures described in the installation guides provided for each agent. When you update an agent, run the same steps as if you are installing a new version. The installation wizard detects the update and installs the product accordingly. Review the product readme for information about enhancements and changes that apply to specific agents. The agents listed in the following sections in this guide require additional steps.

## Update ImageNow Client

Refer to the *Perceptive Content Server and Client Installation Guide* for information about running the installation wizard to update your Perceptive Content Clients. When you update the Perceptive Client, run the same steps as if you are installing a new version. The installation wizard detects the update and installs the product accordingly.

You can update the Perceptive Client several different ways, including installing the client directly, using the automatic updater, or PEDS. To use the automatic updater, refer to the “auto update” readme file. For more information on PEDS, refer to the *Perceptive Enterprise Deployment Suite Installation Instructions*.

Review the product readme for information about enhancements and changes for Perceptive Content Client.

#### Notes

- In previous versions of ImageNow, you used the Automatic Updater. In Perceptive Content 7.0.x, this functionality was replaced with PEDS.
- In previous versions of ImageNow, you used the Perceptive Content Server Administrator (ISA) to perform diagnostic tasks. In Perceptive Content 7.0.x, this general functionality was included in the Diagnostics tab in Management Console.

All existing ImageNow Client tokens are invalidated during the upgrade, and new tokens are generated as each Perceptive Content Client connects to the server.

## Update Perceptive Content Forms Server

Review the product readme for information about enhancements and changes for Forms Server.

**Important** Refer to the *Perceptive Content Technical Specifications* guide for system requirements.

**Important** When you perform an upgrade from an older version to a newer version number, Enterprise Software recommends testing forms in a test environment before implementing in a production environment. Version 6.5 and above includes enhanced features that make this testing step mandatory if you created worksheets or forms on any previous versions. If an error occurs on the form, contact Product Support.

To upgrade an existing version of Forms Server to the latest version, complete the following steps.

1. Stop Tomcat.
2. Back up the entire **[path]/\${TOMCAT\_HOME}/webapps/imagenowforms** folder. You do not need to back up **[path]/\${TOMCAT\_HOME}/work/Catalina/localhost/imagenowforms**.
3. Delete the **[path]/\${TOMCAT\_HOME}/work/Catalina/localhost/imagenowforms** directory.
4. If you used the Windows installer to install Forms Server, uninstall it.
5. Download the WAR file.
6. Place the **psw-content-forms-server.war** file into **[path]/\${TOMCAT\_HOME}/webapps/**.
7. Start Tomcat to extract the WAR file.
8. Optional. When upgrading, to ensure legacy URLs persist, rename the **psw-content-forms-server** directory to **imagenowforms**.
9. Compare the **WEB-INF/imagenowforms.settings** file in your backup to the new **WEB-INF/imagenowforms.settings** file and copy the settings from the older file to the new one, if necessary.
10. Under the **Application server settings** section, in the **integration-server-path** setting, enter the full path to Integration Server.
11. If you updated Forms Server from version 6.4.x to 7.2.x, you must move the **imagenowforms.xml** file from your backup to the **\$(IMAGENOWDIR6)/etc** directory.
12. Restart Tomcat.
13. After verifying that Forms Server is deployed, you can safely remove the backup directory as needed.

**Note** For more information about extracting the WAR file in Tomcat, or information regarding communication between Forms Server and Integration Server, refer to the *Forms Server Installation and Setup Guide Foundations EP1*.

## Update Integration Server

Review the product readme for information about enhancements and changes for Perceptive Integration Server.

**Important** Refer to the *Perceptive Content Technical Specifications* guide for system requirements.

To upgrade an existing version of Integration Server to the latest version, complete the following steps.

1. Stop Tomcat.
2. Back up the entire **[path]/\${TOMCAT\_HOME}/webapps/integrationserver** folder. You do not need to back up **[path]/\${TOMCAT\_HOME}/work/Catalina/localhost/integrationserver**.
3. Delete the **[path]/\${TOMCAT\_HOME}/work/Catalina/localhost/integrationserver** directory.
4. If you used the Windows installer to install Integration Server, uninstall it.
5. Download the WAR file.
6. Place the **integrationserver.war** file into **[path]/\${TOMCAT\_HOME}/webapps/**.
7. Start Tomcat to extract the WAR file. For more information about extracting the WAR file in Tomcat, refer to the *Integration Server Installation Guide*.
8. Compare the **WEB-INF/integrationserver.ini** file in your backup to the new **WEB-INF/integrationserver.ini** file and copy the settings from the older file to the new one if necessary.
9. Restart Tomcat.
10. After verifying that Integration Server is deployed, you can safely remove the backup directory as needed.

## Update Business Insight

Review the product readme for information about enhancements and changes for Business Insight. For installation information, refer to the *Business Insight Installation Guide* located at [www.perceptivesoftware.com](http://www.perceptivesoftware.com). Business Insight 7.1.x and higher is only compatible with Perceptive Content Server 7.1.x and higher.

**Note** Reports generated through the Report from View feature are not guaranteed to work after an upgrade, and will break with a breaking schema change as they are generated using direct SQL.

## Updates from 6.x to 7.0

Refer to the following information upgrading ImageNow, version 6.x, to Perceptive Content, version 7.0.

- Upgrade IBM Cognos server from 8.4.1 FP2 to 10.2.1 FPI.
- Cognos authentication is done through Perceptive Integration Server. No license is required.

**Note** The data source label changes from INOW6 to INOW as part of the upgrade. If you have created a custom report in a previous version of Business Insight using custom SQL or the Create Report from View option, the updated data source name may cause an error when you attempt to run the imported report.

To correct this, open the report, go to the query, and point the query to the correct data source name, INOW.

## Updates from 7.0 to 7.2

Refer to the following information when upgrading Perceptive Content from version 7.0 to version 7.2.

- Direct user name access to the Cognos Connection Portal.
- The Reports section of Management Console has been removed. Reports from View are retained in the View section of Management Console.
- Cognos Mobile is available with this version.

**Note** The Manage Reports privilege has changed, starting in 7.1.0. Perceptive Managers can grant the Reports View privilege to give Content client access. Report Managers no longer implicitly have View and Run access to all reports. These kinds of privileges should be granted directly through Cognos.

## Updates from pre 7.1.5 to 7.2.2

When updating Perceptive Content from versions pre 7.1.5 to version 7.2.2, run the following command to allow you to successfully generate forms using the forms agent.

```
`inUpgradeUtil upgrade-privs --from 7.1`
```

## Upgrade to Business Insight

To upgrade an existing version of Business Insight with the latest version, complete the following procedures on the computer where Business Insight is installed. Before you begin, create a backup of your content store. If you are going to install a newer version of Cognos on the same machine as your existing version, either shutdown your legacy system or adjust the port settings to avoid port conflicts.

There are two options for upgrading Cognos. If you are running incrementals on your INOW database such that all User IDs are retained, you will want to upgrade the existing content store. This will retain all reports and report permissions. If during the upgrade your User IDs will change, a better option is to start from a new content store and import any reports you want to keep from your legacy system.

### Upgrade an existing content store

Upgrading an existing content store is the easiest and most effective way to upgrade Cognos while ensuring that all permissions are retained.

1. Download the setup kit to a temporary directory.
2. To install the version of Business Insight, complete the following substeps.
  1. Open the setup kit and double-click the **ImageNowBI\_Setup.exe** file.
  2. Run the installer according to your operating system and DBMS. Refer to the Business Insight Installation Guide for more information.
  3. If you use an Oracle DBMS for ImageNow, complete the following steps.
    1. In the **Installation Wizard Completed** page, clear the **Launch Business Insight Configuration** check box and then click **Finish**.
    2. Copy the **ODBC.jar** file from the legacy system to your new `<install_dir>\webapps\p2pd\WEB-INF\lib` directory.

4. Configure the Internet Information Services (IIS) Gateway for your new installation as described in the *Business Insight Installation Guide*.
3. Access the **Business Insight Configuration** program and adjust the content store setting to point to your existing content store.
  1. Select **Data\_Access > Content Manager > Content Store**.
  2. Adjust the information to point to your existing content store.
4. Within the **Business Insight Configuration** program, click the **Start** button to start the service.
5. When prompted, upgrade your existing reports to the latest report specification.
6. Cognos should now be running, and all reports should be upgraded.
7. Access the `<install_dir>\bin\utilities\biintegrator` directory and run the Business Insight integration utility to configure the new environment and to import new versions of the reports.

## Upgrade to a new content store

If you want to upgrade using a fresh content store, install Business Insight according to the Business Insight Installation Guide. You will export specific report folders from your legacy system and import them into your new one. These steps will guide you through exporting and importing folders into IBM Cognos.

### Export reports from legacy Cognos

1. Open an Internet Explorer web browser and access the following URL, where `[host name]` represents the name of the Business Insight server computer.  
`http://[host name]/cognos8`
2. Log in to the web interface.
3. Since you can only export folders and not individual reports, create a new folder under **Public Folders** and copy every report you want to export into that folder before you proceed.
4. From the **Launch** menu, select **IBM Cognos Administration**.
5. On the **Configuration** tab, in the left pane, click **Content Administration**.
6. In the **Administration** toolbar, click **New Export** and complete the following substeps.
  1. Enter a name, an optional description, and a screen tip for the report library archive and click **Next**.
  2. Under **Deployment** method, click **Select public folders**, directory and library content and click **Next**.
  3. Under Public folders, directory and library content, click **Add**.
  4. Under **Public Folders**, select the directory created above that you want to export and click the arrow button to move it to the **Selected entries**, then click **OK**.
  5. Optional. If you want to keep the saved output, run history, or schedules associated with the selected reports, check the appropriate option under **Options**. Click **Next**.
  6. On the **Select the directory content – New Export** wizard page, leave the options unchecked and click **Next**.
  7. On the **Specify the general options – New Export** wizard page, leave the default items selected and click **Next**.

8. Under **New archive**, verify the name of the archive.
  9. Optional. To password protect the archive, select the **Encrypt the content of the archive** check box and click **Next**.
  10. If you opted to password protect the archive, enter the encryption password and then click **OK**.
  11. Verify the export details and then click **Next**.
  12. Under **Action**, select **Save** and run once and then click **Finish**.
  13. Verify the export details and then click **Run**.
  14. Click **OK**.
7. The archive is exported to the **[drive:]Program Files/Cognos/c8/deployment** directory.

### Import legacy reports archive

After your new Business Insight environment is set up and running, you can import your exported archive and access your custom reports.

1. Copy the exported archive from your legacy deployment directory and place it into the deployment directory of your new installation.
2. Log in to the new Cognos portal directly: [http://\[host\\_name\]/ibmCognos](http://[host_name]/ibmCognos).
3. Access the **Content Administration** page from **IBM Cognos Administration**.
4. Click the **New Import** button to create a new import job.
5. Select the exported archive from the list and click **Next**.
6. After you update the description information, click **Next**.
7. On the **Select the public folders and directory content – New Import** wizard page, select the folder you want to import and click **Next**.
8. Continue clicking **Next** until you reach the **Select an action – New Import** wizard page. Keep the default action of **Save and run once**, and click **Finish** to run the import job.

After the import has completed, return to your **Public Folder** to view the imported directory with your reports.

### Copy and rename your data source for imported custom reports

When you upgrade to a new version, your custom reports are still configured to refer to the INOW6 data source. Because the data source name changed to INOW in version 7.0, you can create a copy of your data source labeled INOW6 to prevent the reports from breaking.

To create a copy of your data source labeled INOW6, complete the following steps.

1. Open the **Cognos Administration Portal**.
2. On the **Configuration** tab, in the left pane, click **Data Source Connections**.
3. In the right pane, for the **INOW** data source connection, under **Actions**, click **More**.
4. In the **Perform an action – INOW** screen, click **Copy**.
5. In the **Save as a copy** screen, in the **Name** field, type **INOW6**.
6. Click **OK**.

Your custom reports may still break, however, if there was a change to the model they were leveraging inside the report. To remedy the situation, you need to modify the report to refer to the INOW data source and update the usage of the model accordingly.

## Update Envoy to SOAPBridge

**Important** See the *Perceptive Connect Runtime Installation and Setup Guide* and the *1.0.x Perceptive SOAPBridge Connector Installation and Setup Guide* to install and set up SOAPBridge Connector.

When updating Envoy to SOAPBridge, ensure you have completed the following items.

- Populated the pcr.soap.bridge.url in the inow.ini file with the url of a SOAPBridge Connector.
- Retrieved certificates from web services that communicate over SSL/TLS and uploaded them to Perceptive Connect Runtime JAVA trust store, as outlined in the above install guides.
- Updated any iScripts that were using the deprecated overloads and functions exposed from INRemoteService document imaging object.

## Update Fax Agent

To update Fax Agent, you must uninstall and reinstall in your environment. For more information on installing Fax Agent, refer to the *Perceptive Content Interact for Fax Agent Installation Guide* that is located on our website at [www.perceptivesoftware.com](http://www.perceptivesoftware.com).

When you update Fax Agent from a previous version, ensure you back up the btcall.cfg file and the callctrl.cfg file located in the inserver\brooktrout\config directory. Place these files in a temporary directory away from the inserver directory. Run the installer according to the steps in the Fax Agent Installation and Setup Guide. If the CFG files are missing, replace them with the files you backed up and place them in the inserver\brooktrout\config directory.

## Update Output Agent

To update Output Agent on Windows, run the installer according to the Output Agent Installation and Setup Guide. To update Output Agent on Linux, perform the following steps:

1. From **/inservr/bin**, stop the Output Agent service. To stop the services, enter the following information.  

```
./inservrOutput -stop
```
2. Copy the inservrOutput.ini file from the /inservr/etc directory to a backup directory.
3. To download the latest version of Output Agent, perform the following substeps:
  1. Go to [www.perceptivesoftware.com](http://www.perceptivesoftware.com), click **Customer Portal**, and then click **Downloads**.
  2. In the **Downloads** page, in the right pane, in the **Content** section, click the **Clear Search** link.
  3. In the **Downloads** page, in the left pane:
    1. Expand **Platform** and select your Linux platform.
    2. Expand **Product** and select **Output Agent**.
    3. Expand **Product Release** and select the appropriate version.
  4. In the **Downloads** page, in the right pane, select the check boxes for the following files.
    - The latest build of the Output Agent, shown by the highest Build Number.

- Linux Supporting Files.
5. Click the **Download** button and then save the files to a temporary directory on your computer.
  4. From **/inserver**, unzip and tar the **ImageNow\_Output\_Agent\_VERSION#\_BUILD#\_for\_PLATFORM** installer file.
- ```
gunzip ImageNow_Output_Agent_VERSION#_BUILD#_for_PLATFORM.tar.gz
tar -xvf ImageNow_Output_Agent_VERSION#_BUILD#_for_PLATFORM.tar
```
5. From the **inserver** directory, issue the following command to change ownership.
- ```
chown -R root:bin *
```
6. Compare the previous INI files from your backup copy of the **/inserver/etc** directory with the new INI files in **/inserver/etc**. The Windows installer automatically adapts your previous settings to the new settings; however, the installer overwrites any custom comments, settings, or notes that you might have added previously. Alter the new INI files in **/inserver/etc** as needed. These changes appear in the [Appendix B: INI Changes by Release](#) section of this document.
  7. Start the Output Agent service by running **'pwd'/service\_name -start** for all services in the **/inserver/bin** directory.

```
'pwd'/inserverOutput -start
```

## Update Retention Agent

If you are upgrading your system to include a Retention license, the system may require you to start the Retention Agent service manually after installing the license.

To start the Retention Agent service manually, complete the following steps.

**Note** Close all services and client connections before you stop inserver, including any remote agents.

1. Open the **Services** dialog box.
  - In Windows 7, to locate the **Services** dialog box, from the **Control Panel**, click **Administrative Tools**, and then click **Services**.
2. Right-click the **Retention Agent** service and click **Start**.

## Update Perceptive Connector for SAP ArchiveLink

To update Perceptive Connector for SAP ArchiveLink after installation, you must add the ArchiveLink installation directory path to the Tomcat configuration java library path. After you install Perceptive Connector for SAP ArchiveLink, complete the following steps.

1. Stop Tomcat.
2. Navigate to the Tomcat **[path]/\${TOMCAT\_HOME}/bin** directory.
3. Create a **setEnv.bat** file in the directory using the following command.

```
set CATALINA_OPTS=%CATALINA_OPTS% -
Djava.library.path=%PATH%;<PathToImageNowBinDirectory>
```

**Note** If Tomcat is installed as a Windows service, add the `java.library.path` Java options settings from the Tomcat service configuration application. For more information, see the Tomcat documentation.

4. Restart Tomcat.

## Appendix A: Database Changes by Release

Use the following Appendix to understand the database changes required by each release. The incremental SQL scripts listed in the steps above perform these changes in your database. Carefully review the incremental database script for to understand the details of the changes.

Database Changes	Description of Changes
Incremental 6.6.0.125_to_6.6.0.237.sql	<p>Added table:</p> <p>IN_LIC_TOKEN_HWFP</p>
Incremental 6.6_to_6.7.0.2355.sql	<p>Created tables:</p> <p>IN_ACTION_GROUP, IN_ALARM_AGENT_STATE, IN_CAPTURE_SOURCE_OUTLOOK, IN_CLASS_LAYOUT, IN_DEP_TIMING_DATA, IN_DEP_TIMING_PARAM, IN_DEP_TIMING_REPORT, IN_DEP_TIMING_SUMMARY, IN_DOC_TYPE_LIST_REL, IN_INSTANCE_ANCESTRY, IN_INSTANCE_SEQ, IN_JOB_AGENT_STATE, IN_LAYOUT, IN_LAYOUT_COL, IN_LIC_REGISTERED_HW_NODE, IN_LM_SCREEN_CONTEXT_MAP, IN_MESSAGE_QUEUE, IN_MESSAGE_QUEUE_MASTER, IN_OSM_AGENT_STATE, IN_PROJ_CAPTURE_PROFILE, IN_RC_ADDRESSEE, IN_RC_EMAIL_ADDRESS, IN_RC_EMAIL_METADATA, IN_RC_EMAIL_METADATA_ADDRESS, IN_RC_FOLDER, IN_RC_FOLDER_POLICY, IN_RC_FOLDER_TYPE, IN_RC_FOLDER_TYPE_LIST, IN_RC_FOLDER_TYPE_LIST_MEMBER, IN_RC_METADATA, IN_RC_METADATA_ADDRESSEE, IN_RC_METADATA_INSTANCE, IN_RC_PAGE_METADATA, IN_RT_AGENT_STATE, IN_SHORTCUT, IN_TASK_AGENT_STATE, IN_TIMING_HISTORY, IN_USR_VIEW, IN_WF_AGENT_STATE, IN_WF_INTEGRATION_MAP, IN_WF_INTEGRATION_QUEUE</p> <p>Altered columns in:</p> <p>IN_INSTANCE New columns: CLASS_TYPE, IN_INSTANCE, INSTANCE_NAME, CREATION_USR_ID, CREATION_TIME, MOD_USR_ID, MOD_TIME, ADD_USR_ID, ADD_TIME, LOCK_SESSION_ID, LOCK_REVISION_NUM, LOCK_TYPE, DELETION_STATUS, :ACTION_GROUP_ID</p> <p>IN_SC_SESSION New column: DISCONNECT_TIME</p> <p>IN_TIMING_SUMMARY New columns: SERVER_ID, NODE_ID, USR_ID, OS_USER_NAME</p> <p>Created indexes in:</p> <p>XIE1IN_FORM, INSTANCE_IDX_04, INSTANCE_IDX_05, LIC_MON_IDX05, LM_SCREEN_IDX07, PHSÖB_IDX07, SERREG_IDX04, TIMING_S_IDX03, TIMING_S_IDX04, TIMING_S_IDX05, VIEW_IDX08, WF_ITEM_IDX_13</p> <p>Altered indexes in:</p> <p>CMIB_IDX02, DOC_TYPE_IDX2, INSTANCE_IDX_03, TIMING_S_IDX02</p>

Incremental 7.0.5.767_to_7.0.5.860	<p>No schema changes are included in this incremental. The incrementals contain conditional SQL to rename any primary key indexes that do not have the same name as the actual primary key constraint.</p> <p>Note This only affects Oracle databases and fixes any constraint/index name inconsistencies for schemas that started on version 6.4 or earlier. This issue does not exist for SQL Server databases, so the SS incrementals only contain the DML to update the schema version number.</p>

## Appendix B: INI Changes by Release

Use the following table to understand the INI changes required by each release. The installation wizard in Windows updates your INI files. In Linux, you must manually add any INI changes you need that are listed in the following list.

### INI changes from 6.6.x to 6.7.x

File Name	INI Section Heading	Description of Change
inow.ini	[General]	Add setting: resource.monitor.query.timeout
	[Message Queuing]	Add settings: mq.agent.ip.address mq.agent.ip.port mq.agent.ip.general.override
	[Statistics]	Add settings: stats.image.log.type stats.image.timer.period stats.image.start.time stats.image.action.length
	[Envoy] New section	Add setting: date.time.zone.enabled
	[Digital Signature] Remove section	Remove section and settings.
	[OSM]	Remove setting: centera.temp.dir
	[Directory Locations]	Remove setting: user.dir
		Add setting: logging.dir
	[Licenses] New section	Add settings: combo.imagenow.number combo.webnow.number combo.interact.desktop.number
	[Memory] New section	Add setting: receive.memory.threshold.mb

	[Folders] New section	Add setting: <code>search.in.subfolders.enable</code>
inserver.ini	[General]	<p>Remove setting: <code>inowd.heartbeat.timeout</code></p> <p>Add settings:  <code>client.autotimeout.warning</code>  <code>client.alwaysdeletelocalcopy</code>  <code>thumbnail.max.size</code>  <code>thumbnail.batch.size</code>  <code>num.crossnode.cache.workers</code>  <code>navigation-thumbnails.enabled</code> </p> <p>Changed setting functionality: <code>num.workers</code> You can adjust the number of worker threads during runtime without having to stop and restart the Perceptive Content Server.</p>
	[Network]	Add settings: <code>inowd.Primary.port</code> <code>inowd.Secondary.port</code>
	[AutoUpdate]	Remove the section and associated settings.
	[Timing]	<p>Remove settings:  <code>timing.collection.interval</code>  <code>timing.data.life</code>  <code>timing.state.removal.period</code> </p> <p>Add settings:  <code>timing.threshold.enabled</code>  <code>timing.detail.purge.enabled</code>  <code>timing.detail.retention.period</code>  <code>timing.aggregation.enabled</code>  <code>timing.aggregate.purge.enabled</code>  <code>timing.aggregate.retention.period</code> </p>
	[Business Insight]	Add setting: <code>business.insight.max.output.default</code>

	[Folders] New Section	Add settings: folders.move.maximum.results folders.path.delimeter
	[LearnMode] New Section	Add setting: pretrieve.interval
inserverAlarm.ini	[General]	Remove setting: polling.interval
		Add setting: num.workers
	[Modem] Remove Section	Remove section and settings.
	[Email]	Remove settings: smtp.server port
	[Logging]	Remove setting: debug.level.pipe
	[General]	Remove settings: poll.interval number.of.server.agents
		Add setting: remove.old.service
inserverBatch.ini	[Logging]	Remove setting: debug.level.pipe
	[General]	Add setting: remove.old.service
		Add settings: reset.expired.messages minutes.to.expire
inserverEM.ini	[General]	Add setting: remove.old.service
	[Expire] New Section	Add settings: reset.expired.messages minutes.to.expire

inserverFS.ini	<p>[General]</p>	<p>Remove settings:</p> <p>num.transfer.workers</p> <p>num.osm.replication.workers</p> <p>max.osm.replication.retries</p> <p>Add settings:</p> <p>remove.old.service</p> <p>no.work.delay.max.seconds</p>
inserverIMP.ini	<p>[Key Mapping]</p>	<p>Remove settings:</p> <p>Folder</p> <p>Tab</p> <p>F3</p> <p>F4</p> <p>F5</p> <p>Add settings:</p> <p>field1</p> <p>field2</p> <p>field3</p> <p>field4</p> <p>field5</p>
	<p>[DATA_CAPTURE]</p>	<p>Remove settings:</p> <p>capture.template.&lt;n&gt;</p> <p>Add setting:</p> <p>import.DC.Template</p>
	<p>[Remote]</p>	<p>Add settings:</p> <p>heartbeat.interval</p> <p>socket.login.timeout</p> <p>socket.default.timeout</p> <p>reconnect.interval</p>

		Remove settings: serial.number.format serial.number.startvalue bypass.write.cache
	[Serial Number] New Section	Add settings: serial.number.format serial.number.startvalue
	[OSM] New Section	Add setting: bypass.write.cache
inserverJob.ini	[General]	Add setting: remove.old.service
	[Logging]	Remove setting: debug.level.pipe
inserverMonitor.ini	[Logging]	Remove setting: debug.level.pipe
inserverMQ.ini	[General]	Add setting: remove.old.service
		Remove settings: sleep.interval.max sleep.interval.between.send
		Changed setting functionality: num.workers  You can adjust the number of worker threads during runtime without having to stop and restart the Perceptive Content Server.
	[Logging]	Remove setting: debug.level.pipe
	[Network]	Add settings: ip.bind.address ip.bind.port
inserverNotification.ini	[General]	Add setting: remove.old.service

	[Logging]	Remove setting: debug.level.pipe
inserverOSM.ini	[General] New Section	Add settings:  num.transfer.workers  num.osm.replication.workers  max.osm.replication.retries  num.osm.background.workers  osm.cleanup.interval.seconds  max.osm.concurrent.leases  remove.old.service
	[Network]	Changed setting functionality:  num.connection.workers  You can adjust the number of worker threads during runtime without having to stop and restart the Perceptive Content Server.
inserverRetention.ini	[Notification] New Section	Add settings:  notify.frequency  notify.weekly.day  notify.monthly.day  notify.yearly.month  notify.yearly.day
	[General]	Add setting:  work.timeout.seconds  remove.old.service
	[Logging]	Remove setting: debug.level.pipe
inserverTask.ini	[General]	Add setting:  remove.old.service
	[Logging]	Remove setting: debug.level.pipe

inserverWorkflow.ini	[General]	Add settings: num.crossnode.cache.workers remove.old.service
		Changed setting functionality: num.workers You can adjust the number of worker threads during runtime without having to stop and restart the Perceptive Content Server.
	[Workload]	Changed the names of the settings in this section to: retention.removal.schedule.mode retention.removal.schedule.start retention.removal.schedule.duration
		Remove setting: work.load
	[Logging]	Remove setting: debug.level.pipe

## INI changes from 6.7.x to 7.0.x

File Name	INI Section Heading	Description of Change
inow.ini	[ODBC]	Changed setting functionality: odbc.dsn  Removed setting: odbc.grid.max.fetch.count
	[Licenses]	Removed setting: combo.imagenow.number combo.webnow.number combo.interact.desktop.number  Added setting: hardware.amazonec2.support
	[Logon Control]	Change setting functionality: LDAP.ssl.cert.path

	[Full Text]	Change Setting Condition: full.text.integration
	[Migration] New Section	Added setting: migration.enabled
	[iScprit] New Section	Added setting: iscript.encoding
	[Records] New Section	Added setting: records.retain.metadata declare.record.default.organization
inserver.ini	[ClientINI]	Removed setting: client.ini.file.path client.ini.search.grid.file.path
	[Business Insight]	Removed setting: business.insight.address  Added setting: business.insight.url business.insight.dispatcher
	[LearnMode]	Change Setting Functionality: Pretrieve.interval
	[Departments] New Section	Added setting: department.labeling.enabled department.labeling.separator
inserverFT.ini New File	[General] New Section	Added setting: fulltext.workqueue.suspenduntilindexed num.job.workers remove.old.service

	[Logging] New Section	Added setting: debug.level.file
	[Legacy] New Section	Added setting: enabled begin.creation.time end.creation.time minutes.between.legacy.submissions legacy.submission.group.size mime.type.filter drawer.filter field1.filter field2.filter field3.filter field4.filter field5.filter doc.type.filter
	[Network]	Added setting: local.hostname.useoverride local.hostname.override remote.hostname.useoverride remote.hostname.override.OLDNAME active.threshold num.connection.workers num.active.monitor.threads poll.delay.msec ip.port ip.address heartbeat.timeout
inserverIMP.ini	[General]	Added setting: file.encoding

	[Mode DOD_RECOR D]  New Section	Added setting:  manifest.file.ext  dod.file.retry.attempts  dod.file.status.report  file.plan.name  record.type.name  record.folder.type.name
	[DOD Record Metadata Mapping]  New Section	Added setting:  field1  field2  field3  field4  field5
	[Key Mapping]	Changed Setting Functionality:  drawer  field1  field2  field3  field4  field5
inserverMonitor.ini	[Defaults]	Removed setting:  Defaults.Memory  Defaults.CpuUsage  Defaults.NonResponsiveTime  Defaults.TimeSinceStart  Defaults.Threads  Defaults.GDI  Defaults.Handles  Defaults.DumpDirectory  Defaults.ToEmailAddress  Defaults.FromEmailAddress  Defaults.Program

	[Email] Remove Section	Removed setting: Email.SmtpServer Email.Port
	[Ignore] Remove Section	Removed setting: Ignore.AllNonWatchedProcesses
	[Defines]	Removed setting: iConvert iUpgrade
	[Profiles]	Profile1.Event1.Action1.FailedAction1 Profile2.Event1 Profile2.Event1.Action1
	[Processes]	Changed Setting Condition: FullTextAgent MonitorAgent.Event1.Time MonitorAgent.Event1.Day  Removed setting: iConvert iUpgrade
inserverOSM.ini	[Verification] New Section	Added setting: background.validation.enabled min.verify.interval.weeks max.creation.age.weeks
inserverRetention.ini	[Remove]	Added setting: removed.from.hold.group.size
	[Notification]	Added setting: due.for.review.group.size due.for.review.interval.hours

	[Cutoff] New Section	Added setting: delay.between.cutoff max.items.to.cutoff
--	-------------------------	---

## INI changes from 7.0.x to 7.1.x

File Name	INI Section Heading	Description of Change
Agent's Configuration	[Network]	Removed setting: mq.subscriber.active.threshold mq.subscriber.num.active.monitor.threads mq.subscriber.poll.delay.msec mq.subscriber.heartbeat.timeout
inmc.ini	[Remote]	Add File and Setting: socket.default.timeout
inow.ini	[General]	Added setting: num.crossnode.cache.recovery.attempts
	[Network]	Removed setting: mq.acknowledgements.disabled.setting mq.ack.monitor.delay mq.ack.timeout mq.seconds.between.async.connection.attempts remote.mq.override.enabled remote.mq.override.instance.name mq.heartbeat.interval  Added setting: encryption.symmetric.min.key.strength encryption.symmetric.max.key.strength encryption.asymmetric.min.key.strength encryption.asymmetric.max.key.strength

	[Message Queuing]	<p>Removed setting:</p> <p>mq.agent.ip.address mq.agent.ip.port</p> <p>Added setting:</p> <p>mq.host mq.port mq.vhost mq.username mq.password mq.password.encrypted mq.secure.enable mq.validate.server.certificate.enable mq.client.reconnect.interval mq.client.host mq.client.username mq.client.password mq.client.password.encrypted mq.client.secure.enable mq.client.validate.server.certificate.enable</p>
	[ODBC]	<p>Removed setting:</p> <p>odbc.userid odbc.password</p> <p>Added setting:</p> <p>odbc.user.password odbc.user.password.encrypted odbc.user.id</p>
inserverMonitor.ini	[Defines]	<p>Added setting:</p> <p>FileSystemAgent NotificationAgent OSMAgent RetentionAgent</p>

	[Processes]	Added setting: FileSystemAgent NotificationAgent OSMAgent RetentionAgent TaskAgent
inserverWorkflow.ini	[Workload]	Added setting: Workload.preference
Installer.ini	[Nodes]	Change Setting functionality: Inuse=2

## INI changes from 7.1.x to 7.2.x

File Name	INI Section Heading	Description of Change
inow.ini	[Envoy]	Added setting: pcr.soap.bridge.url = http://<location of pcr instance>/rs/soapBridge
	[Experience]	Added section and setting: experience.url = any valid URL
	[Full Text]	Removed section
	[Message Queuing]	Added setting: mq.client.port
	[iScript]	Added setting in patch: iscript.error.disclose.detailed.message
Inserver.ini	[General]	You must explicitly update the disable.pdf.thumbnail.generation property if you wish to utilize the PDF thumbnail generation feature. The system defaults to disabling generation of thumbnail images for PDF files.
inserverAlarm.ini	[Email]	Added setting options: queue.email.link 3 = Alarm Agent includes a Perceptive Experience URL link. 4 = Alarm Agent includes Perceptive Content and Perceptive Experience URL links. 5 = Alarm Agent includes Perceptive Experience URL links. 6 = Alarm Agent includes Perceptive Content and Perceptive Experience URL links.

inserverOSM.ini	[Network]	Removed section
inserverFT.ini	All	Removed file
integrationserver.ini	[General]	Added settings: connection.timeout.logon connection.timeout.search connection.timeout.erm connection.timeout.default stream.cutoff.size stream.transfer.chunk.size

### INI changes from 7.2.x to 7.3.x

Inow.ini	[ODBC]	<b>Added setting:</b> <code>odbc.use_ddriver</code>  <b>Removed Setting:</b> <code>odbc.use_ddriver</code>
	[iScript]	Added setting in patch: <code>iscript.error.disclose.detailed.message</code>

### INI changes from 7.3.x to 7.4.x

File Name	INI Section Heading	Description of Change
imagenow.ini	[Powervu Settings]	Removed setting: WebNowLinkAttach
interact.ini	[Powervu Settings]	Removed setting: WebNowLinkAttach
inow.ini	[Digital Signature]	Removed settings: <code>dig.sig.pwd.webnow.timeout</code>
	[Logon Control]	Removed settings: <code>wn.sso</code> <code>wn.sso.key</code>
	[WebNow]	Removed section

insaplink.ini	[Viewing]	Removed settings: view.webnow.url
inserverAlarm.ini	[Email]	Updated setting options: queue.email.link 1 = no longer supported.
Inserver.ini	[OpenID Connect Login Profiles]	Added settings: sso.openid.profiles sso.openid.profile.<profileName>.client.id sso.openid.profile.<profileName>.client.secret sso.openid.profile.<profileName>.user.claim sso.openid.profile.<profileName>.auto.discovery sso.openid.profile.<profileName>.discovery.endpoint sso.openid.profile.<profileName>.issuer.uri sso.openid.profile.<profileName>.token.endpoint sso.openid.profile.<profileName>.userinfo.endpoint sso.openid.profile.<profileName>.discovery.refresh.interval.seconds sso.openid.profile.<profileName>.discovery.minimum.refresh.interval.seconds sso.openid.profile.<profileName>.pkce.required sso.openid.profile.<profileName>.scope sso.openid.profile.<profileName>.trusted.clients sso.openid.profile.<profileName>.id.token.signed.response.alg sso.openid.profile.<profileName>.token.expiration.time.seconds sso.openid.profile.<profileName>.max.age.allowed.skew.seconds sso.openid.profile.<profileName>.proxy.url sso.openid.profile.<profileName>.tls.validate sso.openid.profile.<profileName>.request.timeout.seconds

## INI changes from 7.4.x to 7.5.x

File Name	INI Section Heading	Description of Change
imagenow.ini	[Powervu Settings]	Added setting: NewFolderVwrFromExplorer
	[Forms]	Added setting: ViewerUseWebXMLTransform

integrationserver.ini	[SSO]	<p>Added setting:</p> <p>ssoopenid.profile.&lt;profileName&gt;.allowed.app.types  ssoopenid.profile.&lt;profileName&gt;.validate.hostname</p> <p>Updated setting:</p> <p>ssoopenid.profile.&lt;profileName&gt;.max.response.value.size</p>
	[Forms]	<p>Added setting:</p> <p>forms.transform.output.method  forms.fallback.transform.output.method</p>

## INI changes from 7.6.x to 7.7.x

File Name	INI Section Heading	Description of Change
inserverRec.ini	[General]	Updated default value orc.dir=\$(IMAGENOWLOCALDIR6)\ocr

## INI changes from 7.7.x to 7.8.x

File Name	INI Section Heading	Description of Change
inserverConvert.ini	[Email]	Added settings: smtp.server.url smtp.validate.certificates smtp.use.starttls smtp.username smtp.password
inserverFax.ini	[Outbound]	Added settings: outbound.fax.smtp.server.url outbound.fax.smtp.validate.certificates outbound.fax.smtp.use.starttls outbound.fax.smtp.username outbound.fax.smtp.password
inserverNotification.ini	[Email]	Added settings: smtp.server.url smtp.validate.certificates smtp.use.starttls smtp.username smtp.password

## INI changes from 7.8.x to 7.9.x

File Name	INI Section Heading	Description of Change
integrationserver.ini	[General]	Added setting: session.csrf.query.parameter.enabled
innow.ini	[Capture]	Added settings: bypass.drawer.lock.on.capture
	[Memory]	enable.private.heap.allocators
	[Session Management]	inowd.session.cleanup.batch.size
	[Cross Node Cache]	cache.offline.state.grace.period.seconds

## Appendix C: Perceptive Content Upgrade Paths

You can upgrade to the latest version of Perceptive Content from any previous version of Perceptive Content and from ImageNow 6.6.0.212 and later. To perform an upgrade, see the installer upgrade commands below.

### Installer upgrade commands

When performing an upgrade, the installer runs the upgrade commands for the version to which you are upgrading. The following sections provide the required commands for upgrading to Perceptive Content.

#### INTool commands

Upgrading from 7.1.2 or earlier

```
intoool --cmd expire-digital-ids
```

For all upgrades

```
intoool --cmd reset-queue-user-count  
intoool --cmd create-default-view
```

#### INUpgradeUtil commands

Upgrading from 6.6

```
inUpgradeUtil upgrade-context-maps
```

Upgrading from 7.1.2 or earlier

```
inUpgradeUtil upgrade-digsig-version
```

Upgrading from 7.1.3 or earlier

```
inUpgradeUtil upgrade-policy-queues  
inUpgradeUtil reset-policy-apply-jobs
```

Upgrading from 7.1.4 or earlier

```
inUpgradeUtil process-jobs-invalid-state  
inUpgradeUtil republish-jobs
```

For all upgrades

```
inUpgradeUtil upgrade-cas-to-ext  
inUpgradeUtil upgrade-default-osm-sets  
inUpgradeUtil clean-audit-templates  
inUpgradeUtil upgrade-audit-templates  
inUpgradeUtil upgrade-custom-properties  
inUpgradeUtil upgrade-approval-task-templates  
inUpgradeUtil upgrade-type-holds  
inUpgradeUtil upgrade-workflow-routes  
inUpgradeUtil upgrade-views  
inUpgradeUtil upgrade-users  
inUpgradeUtil upgrade-view-columns  
inUpgradeUtil upgrade-osm --level 3  
inUpgradeUtil update-rules --level 3  
inUpgradeUtil upgrade-privs --from <major.minor version number>
```

## Appendix D: Perceptive iScript Standard Template Library

### iScript Standard Template Library

The iScript Standard Template Library (STL) is a library of functions created to increase the speed and effectiveness of iScript development. The library is available to any Enterprise Software customer with a current iScript license. The STL is updated for new releases of Perceptive Content. If you use the STL, you should upgrade the library when upgrading to a new version of Perceptive Content. You can download the iScript STL from the Downloads tab through the Customer Portal.

## Appendix E: Discontinued products

When a product is discontinued, it must be manually uninstalled from your system. In some cases, the product is automatically uninstalled during the upgrade process. The following products have been discontinued.

### Discontinued in 7.1.5

- Message Agent
- Message Queuing Agent

**Note** When upgrading to 7.2, Message Queuing Agent is automatically uninstalled.

### Discontinued in 7.2.1

- ImageNow Content Server 6.7
- Full Text Search Agent 7.0-7.1
- Lexmark Secure Content Monitor (LSCM)
- Cluster Resource Monitor

## Appendix F: Upgrade to 64-bit Perceptive Content on Linux

### Pre 64-bit Linux upgrade checklist

To successfully identify differences between environments, perform the following steps for every environment of Perceptive Content that you plan on upgrading.

1. Upgrade to the latest Perceptive Content release.
2. Backup your Perceptive Content workspace.
3. Review the following Perceptive Content components for breaking changes:
  - Third-party OSM plugins. These plugins are located in the bin/plugins directory.
  - Review iScript dependencies and libraries loaded from scripts.
  - Review iScript dependencies and executables that are expected to be in the bin directory.
  - Perform the steps in the [Audit and validate components](#) section.

4. After you review all dependencies and establish a go-forward plan to ensure compatibility with 7.4.0, you can proceed with the upgrade.

## Audit and validate components

Perform the actions below to audit and validate the components that the system adds to the Perceptive Content workspace after performing the upgrade. Review all 32-bit binaries and their dependencies. 64-bit Perceptive Content will no longer be able to load these libraries.

1. Copy the current Perceptive Content workspace to a temporary review folder.

```
cp -r /opt/inserver/bin /opt/inserver_review/bin
```

2. Copy Perceptive Content 7.4.0 artifacts into a temporary review folder.

```
cp --force -r /opt/inserver7.4.0/bin/* /opt/inserver_review/bin/
```

3. Find and list all 32-bit components.

```
cd /opt/inserver_review/bin
find . -type f -exec file '{}' \; | grep 32-bit
```

4. Determine the appropriate 64-bit upgrade path for each of the 32-bit components identified.

## Appendix G: Configure default secure protocols for Microsoft Windows HTTP Services

To specify additional secure protocols for WinHTTP using the `DefaultSecureProtocols` registry entry, configure the following.

- Determine the secure protocols you want to allow and calculate the value of `DefaultSecureProtocols` registry entry.

The registry value is a **DWORD** bitmap that specifies which secure protocols are acceptable by default. The value to use is determined by adding the values corresponding to the protocols desired.

<b>DefaultSecureProtocols</b>	<b>Description</b>
0x00000008	The SSL 2.0 protocol can be used by default.
0x00000020	The SSL 3.0 protocol can be used by default.
0x00000080	The TLS 1.0 protocol can be used by default.
0x00000200	The TLS 1.1 protocol can be used by default.
0x00000800	The TLS 1.2 protocol can be used by default.
0x00002000	The TLS 1.3 protocol can be used by default.

For example, if you want to override the default values for `WINHTTP_OPTION_SECURE_PROTOCOLS` to specify TLS 1.1 and TLS 1.2, take the value for TLS 1.1 (0x00000200) and the value for TLS 1.2 (0x00000800), add them together in a calculator (in programmer mode), and the resulting registry value would be 0x0000A00.

- Using a tool such as the Windows Registry Editor or PowerShell, create or modify the DefaultSecureProtocols registry entry using the calculated value:

HKEY\_LOCAL\_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\Internet Settings\WinHttp

- On x64-based computers, you must also configure DefaultSecureProtocols registry entry on the Wow6432Node registry path using the calculated value:

HKEY\_LOCAL\_MACHINE\SOFTWARE\Wow6432Node\Microsoft\Windows\CurrentVersion\Internet Settings\WinHttp
