Overview

This guide contains information about product enhancements and updates in the Saperion 8.0.1 product. Product enhancements list additional functionality available for your system. Updates list known corrections to your Saperion ECM 8.0.1 system.

Saperion 8.0.1 Release [*October, 2017*]

This release includes the following version.

- Saperion 8.0.1

Product enhancements

This release provides the following product enhancements.

Web Client

- Added a functionality that detects duplicate sessions and provides the user option to terminate previous sessions. (US39318)

ECM Service

- Added a functionality that allows an API to impersonate a Saperion user. (US39361)

Updates

This patch includes the following updates.

Rich Client

- Resolved an issue where the render engine did not change the DPI of an image while converting it to PDF. (19847)

- Resolved an issue where attempts to open any of the documents that are simultaneously linked to each other failed. (72628)

- Resolved an issue where saving a multipage TIFF file by dragging it from the result list to a local directory or desktop did not compress the files correctly even if a compression format was selected. (72651)

- Resolved an issue where an attempt to deactivate the absence of a user during login did not add an entry to the audit table. (72721)

- Resolved an issue where saving documents rendered from the structure window or thumbnail view exported only the viewed pages. (72803)

- Resolved an issue where downloading a document using the Rich client or COM API did not execute an audit event. (73237)

- Resolved an issue where users were able to log in to Saperion without any authentication after first attempt to log in failed due to wrong password. (73463)

- Resolved an issue where an error appeared while reindexing a document in a DDC that was created with Client-Function, which uses the "All clients in table" option. (73607)

Web Client

- Resolved an issue where a right-click on an item in the workflow inbox did not display the "Document Index" option in the shortcut menu. (23808)

- Resolved an issue where old revisions of a document were not accessible when MediaViewer was used. (72667)

- Resolved an issue where clicking the "Result" button multiple times on Internet Explorer 11 consumed more memory. (73249)

- Resolved an issue where mask controls did not update local language when localization cache was disabled at Tomcat. (73781)

- Resolved a heap space error while uploading files larger than 650 MB. (73874)

- Resolved an issue where a value for the System field was not created while uploading a document in WebClient. (74105)

- Resolved an issue where some options in the control panel were not translated to German language. (74292)

Core Server

- Resolved an issue by adding a configuration that allows users to switch to a continuous numbering system in the structure window that was followed in Saperion version 7.1 and earlier. (73426)

- Resolved an issue where errors were logged in the core server log file during a core server restart but no error messages were displayed on the screen. (73542)

Classic Connector

- Resolved an issue where the createFolder method failed when a large multi-value property was set. (21119)

- Resolved an issue that displayed an error message when you archived a document using classic connector or webservice if the document had more than thousand entries in one or more multi-value fields. (73262)

- Resolved an issue where an error occurred in the JavaCoreServer when the searchHQL query returned a NULL value to the database. (73469)

Storage

- Resolved an issue by performing consistency checks of media database to prevent duplication of document IDs. (71862)
